

CENTRAL PERFORMANCE TEST REPORT FOR BEEF BULLS

MAR 2003

Attached are performance test results for the group of beef bulls which completed central performance test in Mar 2003 at the beef performance testing station at Tully, Co Kildare.

Performance testing

Central performance testing is a central part of the national programme for the genetic improvement of beef cattle in Ireland and provides very useful information for selecting bulls for entry into AI. The testing is organised by I C B F, the Irish Cattle Breeding Federation in conjunction with the Herdbook Associations who organise the selection of the bulls. Performance testing involves the evaluation of selected beef bulls of various beef breeds from many herds for a number of important economic traits. It is the only way by which economically important feed conversion efficiency trait can be accurately evaluated. Pedigree bulls are evaluated under uniform conditions of feeding, housing and management in order to identify the genetically superior bulls. Central performance testing enables more accurate estimates of breeding values to be obtained very early in a bulls breeding life in contrast to an on-farm or a progeny test which takes significantly longer and does not evaluate feed efficiency.

Bulls enter the test station at approximately 6 months of age having passed a thorough health test. They remain on test for approximately 6 months. They are fed to appetite on a high quality diet. Feed intakes are individually recorded to facilitate the estimation of feed efficiency.

Traits Measured and Evaluated

Many traits including Growth Rate, Feed Conversion Efficiency, Carcass Merit and Withers Height are recorded. Carcass merit is evaluated by recording eye muscle area and fat area using ultrasound-scanning equipment.

The recorded traits are combined to give three sub-indices as follows:-

- Growth Index which is calculated primarily from the adjusted final weight and withers height of the bull;

- Feed Conversion Index;
- Carcass Merit Index which is calculated from the eye-muscle area, fat area and visual muscling score of the bull;

Finally these sub-indices are combined to give an overall index of merit called the BEEF MERIT INDEX. Approximately equal weightings are given to each sub-index in the calculation of this overall index.

The interpretation of these Indices

The breed means for the beef merit index and the sub-indices are set to a national breed average of 100. The standard deviations of the indices are set to 10. Bulls scoring 110 or greater in any indices are expected to come from the top 15% of the national population and bulls scoring 90 or less are expected to come from the bottom 15% of the population for that index.

By choosing a bull from the top of its breed for genetic merit, a beef producer can expect to increase overall profitability by either reducing production costs or increasing carcass value.

Linear scoring

Linear scoring is now becoming a widely used tool in the evaluation of beef breeding animals. It has long been used in the dairy industry to describe type traits in dairy animals. As more breed Associations are now incorporating the tool into their breeding strategies, it is now appropriate that the BLUP linear scoring evaluation system be used in place of the visual assessment procedure used in the past at the central performance test station. The linear scoring procedure is being adapted to harmonise with ICAR guidelines. Historically a single overall visual assessment score was given to each bull upon completion of the test. Such a single figure failed to describe the various physical or anatomical characteristics of the animal. Good traits could compensate for poorer traits. Linear scoring in contrast describes an animal by assigning a score to a range of anatomical sites on the animal. These sites are grouped into the categories of muscular, skeletal, functional and other. The scoring system is designed to cover the biological range expected

when describing animals in a particular age range. Muscular traits are assigned scores, which under a revised system will range from 1 to 15 while the remainder are assigned scores in the range 1 to 10. Again in conjunction with the various breed Associations, a number of linear scorers are being approved to provide a standardised linear scoring service. These linear scorers will be required to regularly come together and jointly score animals in order to ensure that common standards are being applied.

The linear scoring procedure is also being incorporated into the AI beef bull progeny test programme. Linear score BLUP breeding values are calculated on a routine basis for the participating breeds.

Issued by the Irish Cattle Breeding Federation
