

IRISH CATTLE BREEDING FEDERATION

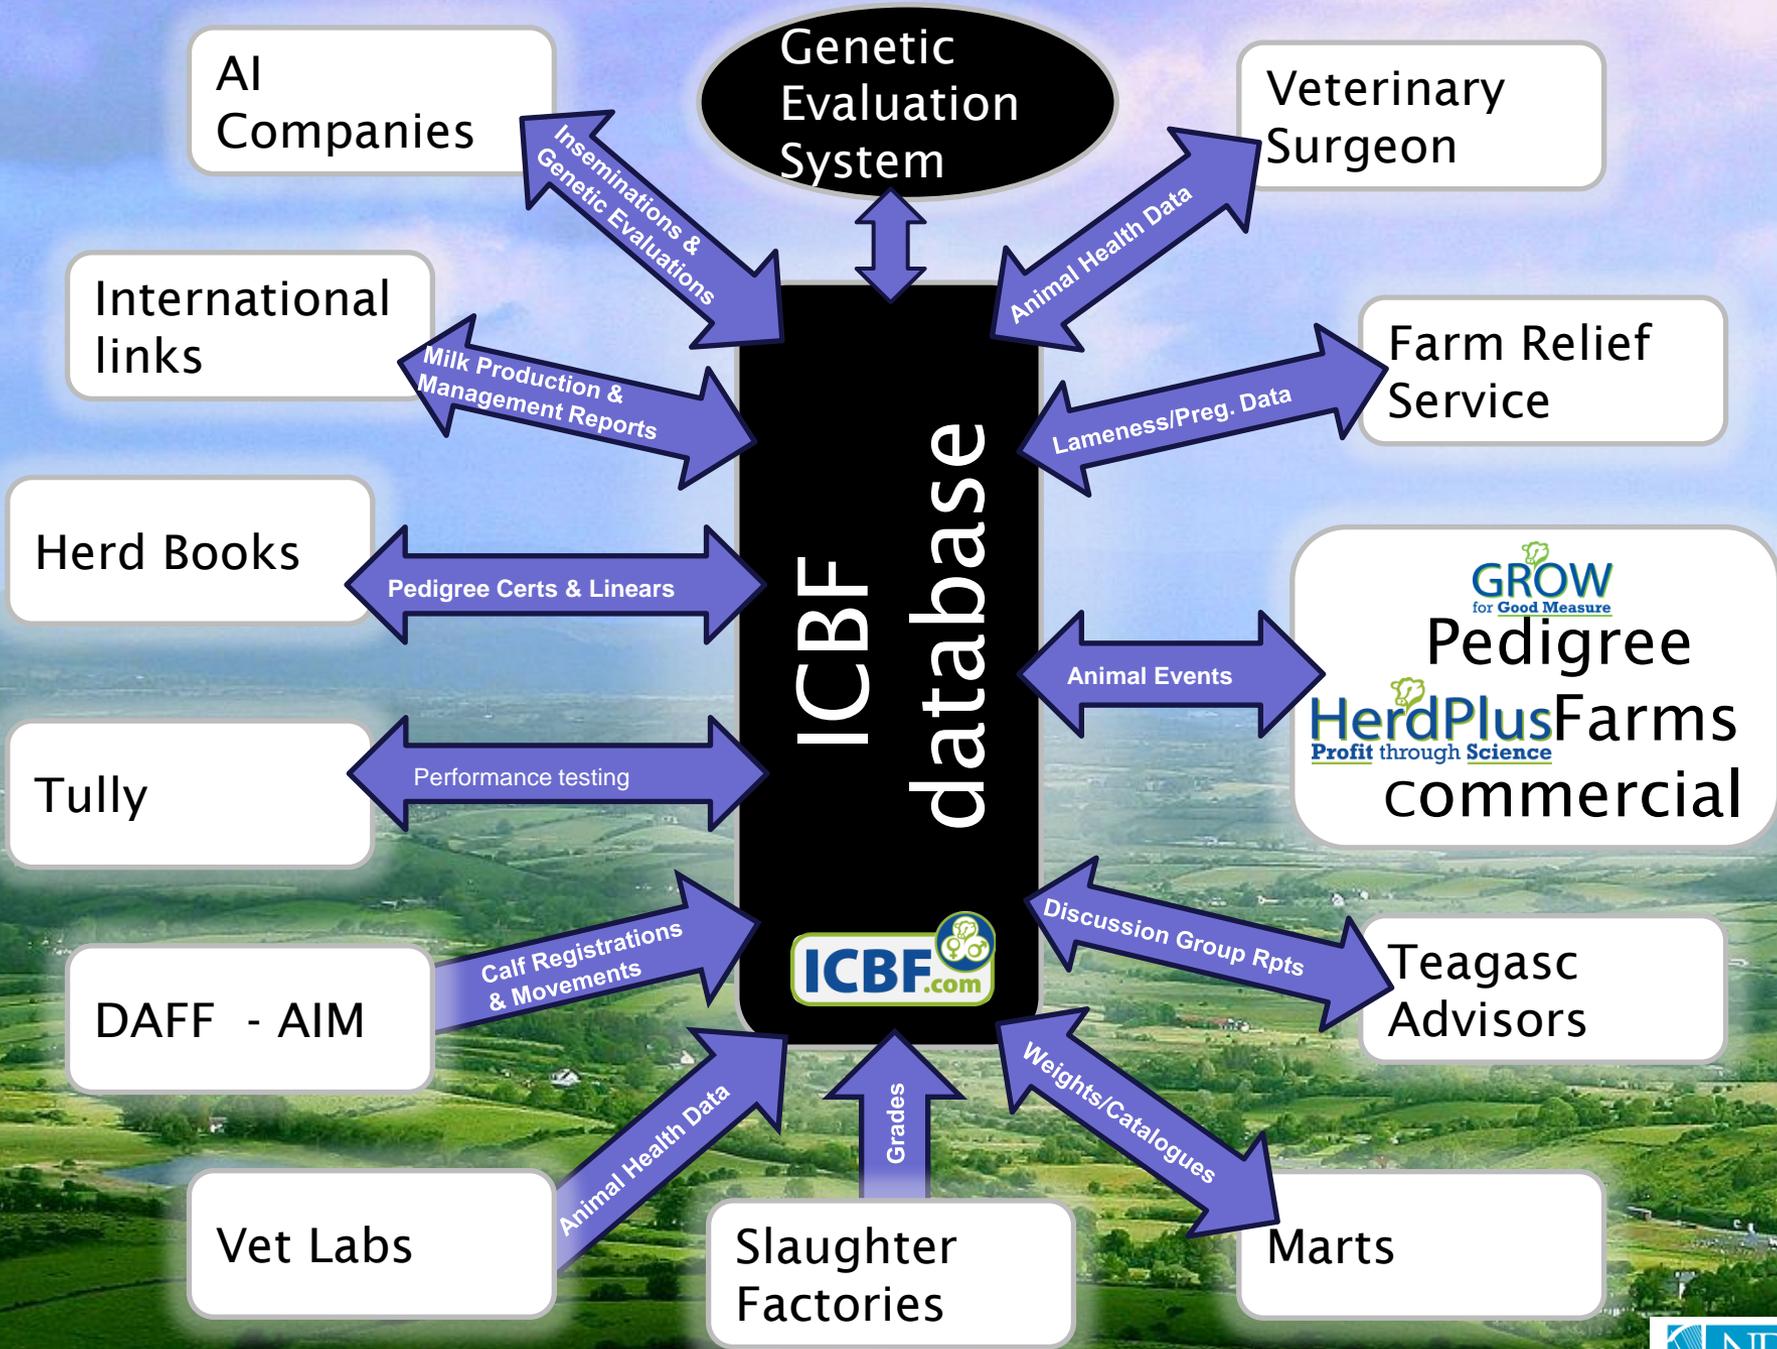

Meat quality. What is the future and why is it important?

Stephen Conroy, Andrew Cromie & Thierry Pabiou (Irish Cattle Breeding Federation)

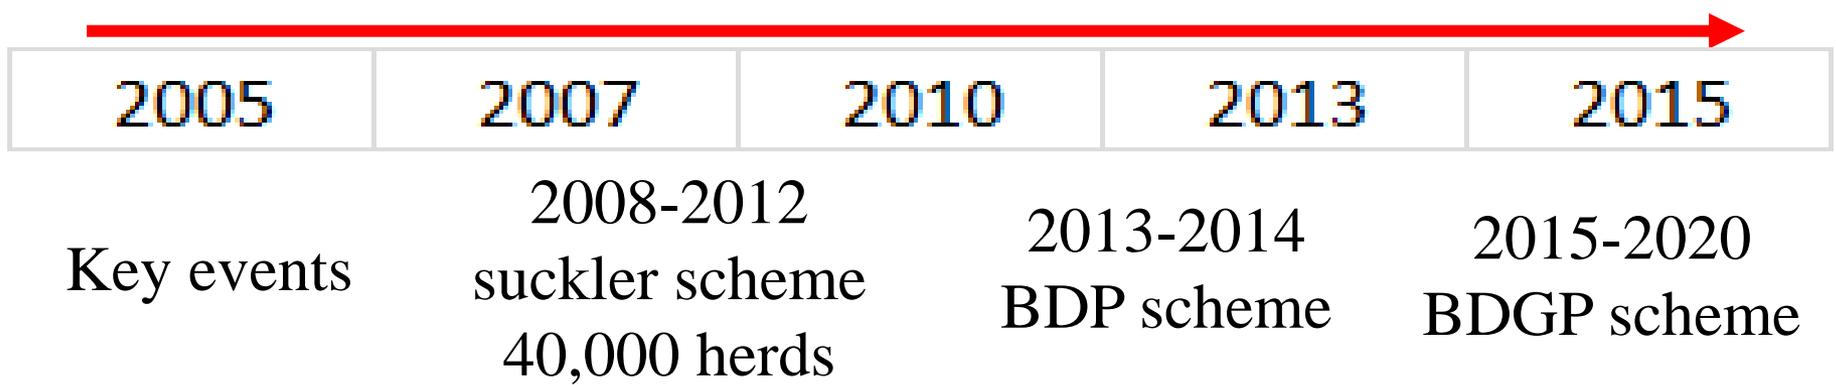

ICBF Background

- ICBF Formally Established in 2000.
- Membership/Board: AI companies (18%), Milk Recording (18%), Breed Societies (18%) & Farmer Organisations (46%).
- Stakeholders in cattle breeding control decision making.
- Mission: *To achieve the greatest possible genetic improvement in the national cattle herd – Dairy & Beef.*

Recent history of beef evaluations

Within breed muscle and skeletal for LM, CH, SI 40,000 recs	Calving (200,000) and Carcass evaluations (100,000 records)	Fertility and milkability evaluations. First overall beef profit indexes	39 million pedigrees Calving 10 million Livewts 4 million Mart 2 million Carcass 7 million Fertility 4 million 50,000 foreign ebvs 750,000 genotypes
----------------------------------------------------------------------------	----------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

How does ICBF make an impact?

The body in charge of the recording and processing of all data in Irish cattle breeding.

Genetic Indexes

EBI

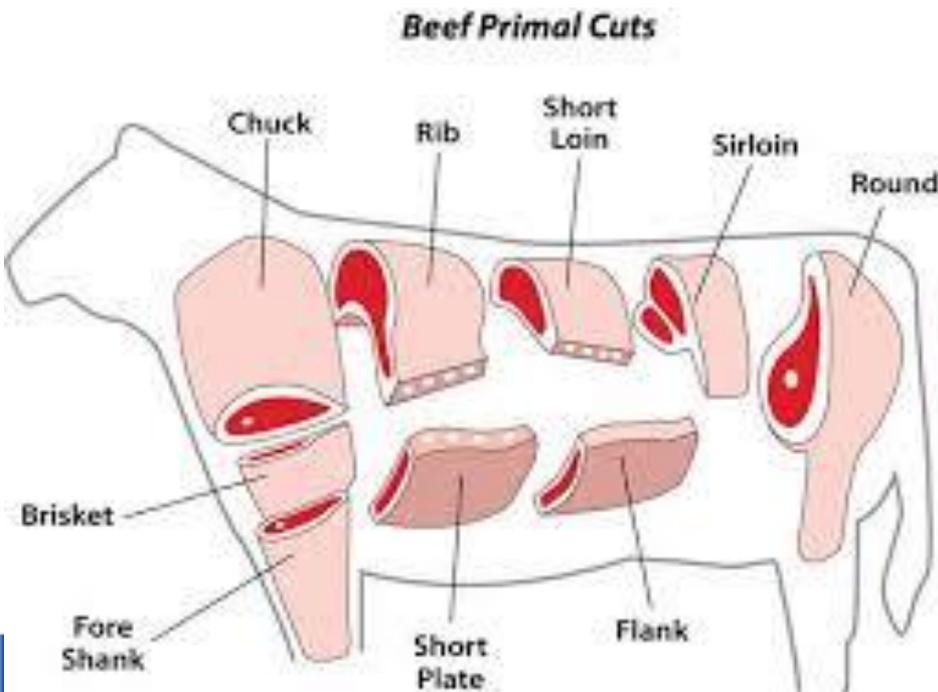

€uro-Stars

Intended to help farmers to make more profitable and efficient breeding decisions.

What is meat quality?

- ❖ **Meat quality** is defined by the **compositional quality** (lean to fat ratio) and the **palatability factors** such as visual appearance, smell, firmness, juiciness, tenderness and flavour.

Meat quality – Why is it important?

- ❖ Consumer tracking data (Pelegri Research Group, 2014; Lusk and Murray, 2015) suggest that “taste” is number 1 attribute for majority of consumers and is the primary reason consumers purchase beef when compared with other types of meat.
- ❖ Consumers want to “trade up”. In the USA Certified Angus Beef® (CAB) increased by 112 percentage points between 2009 and 2014, whereas demand for commodity Choice beef declined by 2 percentage points (Zimmerman and Schroeder, 2013; Suther, 2015).
- ❖ Consumers don’t buy carcasses. Consumers want to buy guaranteed meal results (Dr. Rod Polkinghorne).
- ❖ Consumers take up to 3 months to purchase beef after a bad experience.
- ❖ Finishers are generally not rewarded for eating quality apart from some breed premium schemes. Despite, recent studies showing that there is more variation within breeds for meat tenderness than between breeds (Koothamaraie et al., 2005).
- ❖ There is a need for farmers and processors to work together to produce a more consistent product for consumers.

Can we breed for better meat eating quality?

- Huge improvements in meat eating quality over past 10 years (e.g., animal handling, slow-chilling, hip-hanging & dry-age process).
- However, genetic influence for meat eating quality needs to be further explored as genetic improvement is cumulative and permanent.
- Breed premium schemes in place in Ireland (Angus, Shorthorn & Hereford).
- Objective: Quantify the influence of genetics on meat eating quality and identify the best sires for the trait to be used in the national breeding program.

Data collection

- ❖ 1,508 (1168 bulls and 340 steers) animals finished at Tully test station
- ❖ Slaughtered from 2013 to present
- ❖ All progeny of AI sires – DNA verified

Measurements obtained

- ❖ **Acclimatisation period: (30 days).**
 - Vaccination IBR, BVD, RSV, PI3, Blackleg & other clostridia diseases.
- ❖ **Diet**
 - Bulls (ad-lib concentrates); Steers (8 kg concentrates & 5 kg hay freshweight)
- ❖ **Performance test measures (90 day testing period).**
 - Average daily gain (g/day), Feed conversion efficiency (DMI/ADG), Linear Scores, Scanned muscle and fat depth and intramuscular fat (mm) & Scrotal circumference (cm).
- ❖ **Health & disease traits.**
 - Recording lameness, genetic defects, pneumonia and other illnesses.
- ❖ **Genomics.**
 - Genotyped using customised chip.
- ❖ **Age at slaughter**
 - Bulls (15-18 months)
 - Steers (17-23 months of age)

Measurements obtained at the factory

- Meat quality
- Carcass wt, fat and conformation
- Primal yields
 - British spec
 - 19 different cuts
- pH
 - Hourly and ultimate

Measurements obtained cont'd

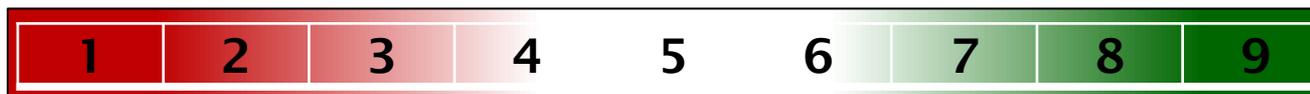

- Meat eating quality
- Colour of loin
- Visual marbling of the loin
- Composition analysis
 - Intramuscular fat %, protein % & moisture %
- Cook loss and shear force
- Sensory analysis

Sensory analysis

Meat Tasting Phenotypes

3 phenotypes: **Tenderness**, **Juiciness**, & **Flavour** - Scored 1 to 9

“Extremely Tough”
“Not at all Juicy”
“Off-note”

“Extremely Tender”
“Extremely Juicy”
“Extremely flavoursome”

Meat Tasting Protocol

Longissimus thoracis muscle from right side of each carcass 2.5cm steaks and vacuum packed. Steaks were aged for 14 days before being frozen. They were then thawed at 4°C 24 hours before analysis

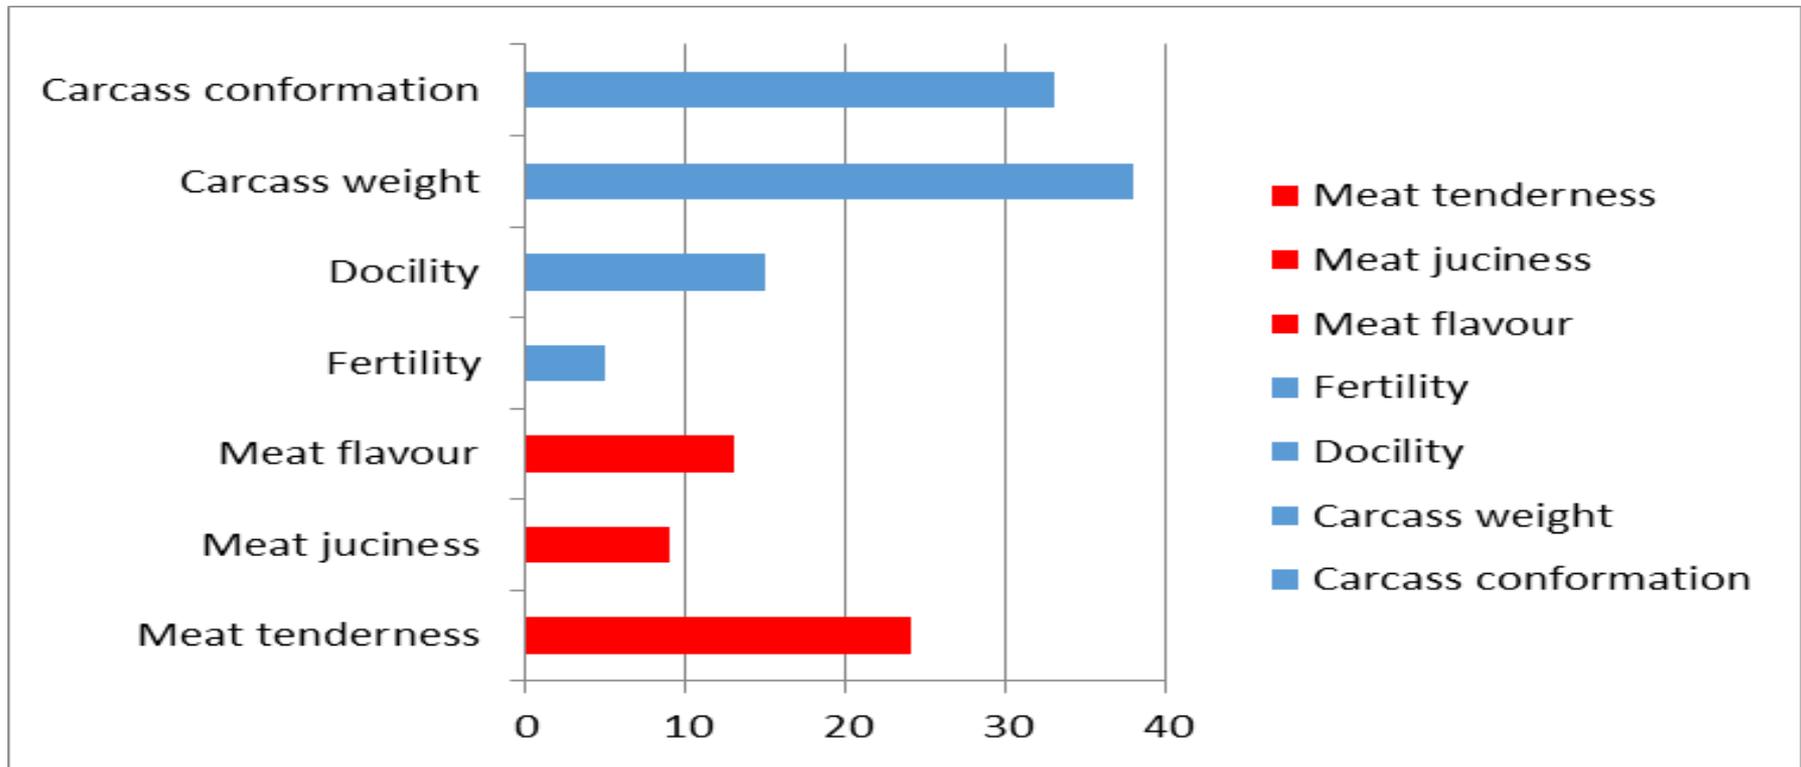

Grilled to a ‘medium’ cooking finish, allowed to rest for two minutes. Data was collected using trained panelists.

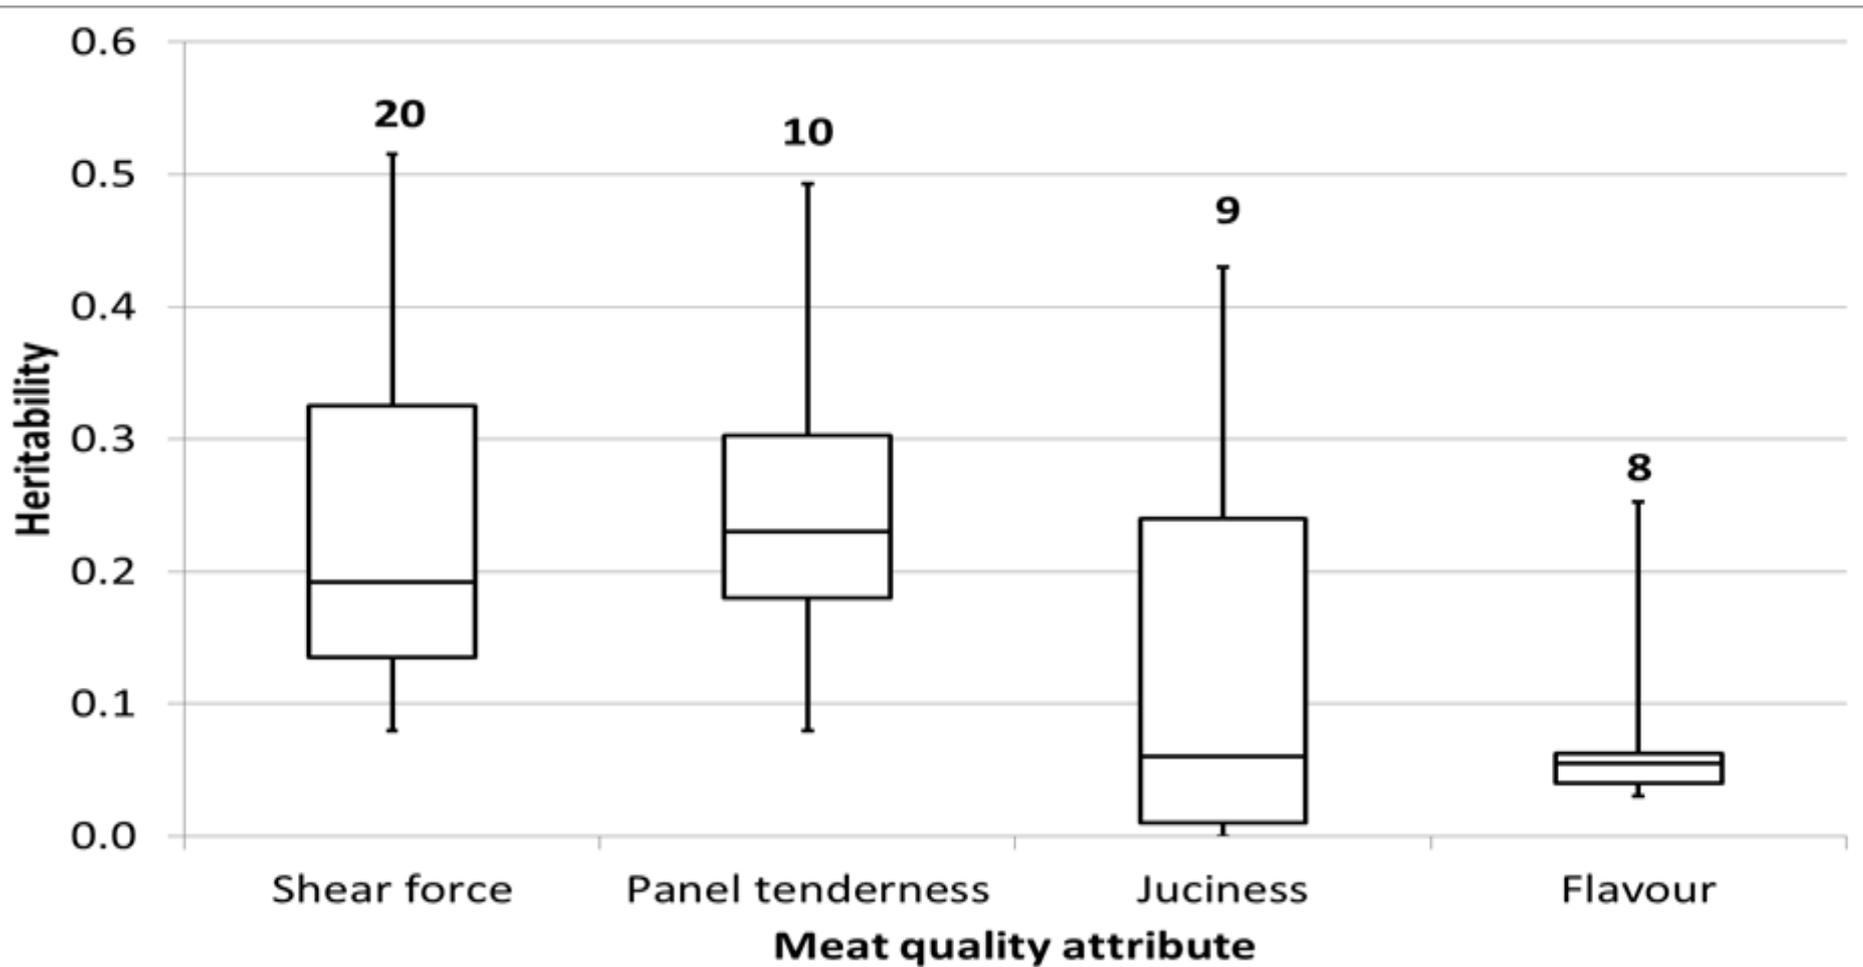

- Eolas International, Co. Cork
- 7-10 trained panellists
- <http://www.eolasinternational.com>

Heritability for eating quality traits

- ❖ In order to make genetic progress a trait must be heritable. A heritable trait is one that is passed from a parent to offspring.

Heritability - International studies

Consumer Validation

LIVESTOCK IRISH FARMERS JOURNAL Saturday 23rd July 2016

Breeding better beef

The ICBF puts eating-quality index to the test

The ICBF put its newly developed beef eating quality index to the test at BEEF 2016 last week and the results are promising, writes Cláirín Lenehan

Key points

- The ICBF has developed a genetic index for beef eating quality.
- Data from 1,200 bulls fed at Tully progeny-testing centre used to develop index.
- Tested on 101 consumers at BEEF 2016. Given two steak samples, one from a high- and one from a low-index animal.
- Asked to identify high eating-quality index beef.
- 75% correctly identified the high-index eating quality beef.

It's quite rare to happen when a genetic index for beef eating quality is put to the test at a major event such as BEEF 2016. The ICBF has developed a genetic index for beef eating quality, based on data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index. The index is based on a genetic index for beef eating quality, based on data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index. The index is based on a genetic index for beef eating quality, based on data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index.

Building an index

The index was developed by using data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index. The index is based on a genetic index for beef eating quality, based on data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index.

BEEF 2016 consumer testing trials

The index was tested on 101 consumers at BEEF 2016. Given two steak samples, one from a high- and one from a low-index animal. The index is based on a genetic index for beef eating quality, based on data from 1,200 bulls fed at Tully progeny-testing centre used to develop the index.

Results

75% correctly identified the high-index eating quality beef.

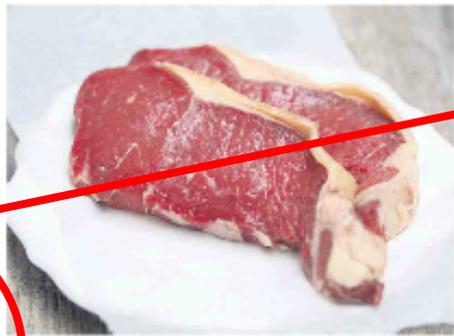

Table 1: Top 10 cuts for meat eating quality

Rank	Item	Score	Owner
1	Wet forequarter	90.6	Devco
2	Hot forequarter	89.6	Devco
3	Red forequarter	88.6	Devco
4	Eye of round	87.6	Devco
5	Brisket	86.6	Devco
6	Cape of shoulder	85.6	Devco
7	Wet forequarter	84.6	Devco
8	Hot forequarter	83.6	Devco
9	Red forequarter	82.6	Devco
10	Eye of round	81.6	Devco

Table 2: ICBF consumer testing session, Tully progeny-testing centre, 23 July 2016

Pair	High eating quality steak			Low eating quality steak			Consumer selected "high"	
	Brand	Tag No.	ERV	Brand	Tag No.	ERV	High ERV	Low ERV
1	BD	176	3.3	OD	462	-0.3	5	2
2	CA	99	3.6	CA	967	-0.2	6	1

Role of genomics

- Ireland recently rolled out a Beef data genomics program (BDGP)
- Focused on breeding more profitable, sustainable and carbon efficient cows.
- Funded from EU Rural Development Program.
 - Under article 28 (Climate + Environment).
 - Co-funded by Irish government (DAFM).
- €300m total funding 6 years (2015-2020)
 - Farmers paid ~€90/cow/year to complete 6 actions
- ~2.5m animals will be genotyped during period of scheme.

What is Genomics?

- The use of DNA information to predict how good an animal might be. Important tool in accelerating genetic gain
- Up to now we relied on parentage information on young animals
- We then need to wait until they have progeny to see how good they 'breed'
- DNA gives an extra 15-30% in terms of reliability.
- This is added to the existing Euro-Star indexes of the animal => more accurate evaluation.

Role of genomics for eating quality

- ❖ Genetic evaluation using genomics will allow for more accurate identification of the the best bulls for eating quality

LISDUFF DANDY ZFL

EURO-STAR INDEX (ICBF - April 2014)

Star Rating within Angus breed	Economic Indexes	Euro Value	Index Reliability	Star Rating across all beef breeds
★★★★★	Replacement	€198	48% (Ave.)	★★★★★
	Maternal Cow Traits	€109	33%	
	Maternal Progeny Traits	€88	62%	
★★★★★	Terminal	€52	60% (High)	★★★★★

EXPECTED PROGENY PERFORMANCE

Star Rating within Angus breed	Key Profit Traits	Index Value	Trait Reliability	Star Rating across all beef breeds
	Calving difficulty (% 3 & 4)	5.00%	93% (V.High)	
	Breed ave: 2.28%. All breeds ave: 4.99%			
★★★★★	Docility (1-5 scale)	-0.04	67% (High)	★★★★★

Meat quality. What next?

- In Ireland carcasses are graded mechanical carcass grading has replaced visual grading
 - ✓ Video imaging analysis (VIA) system

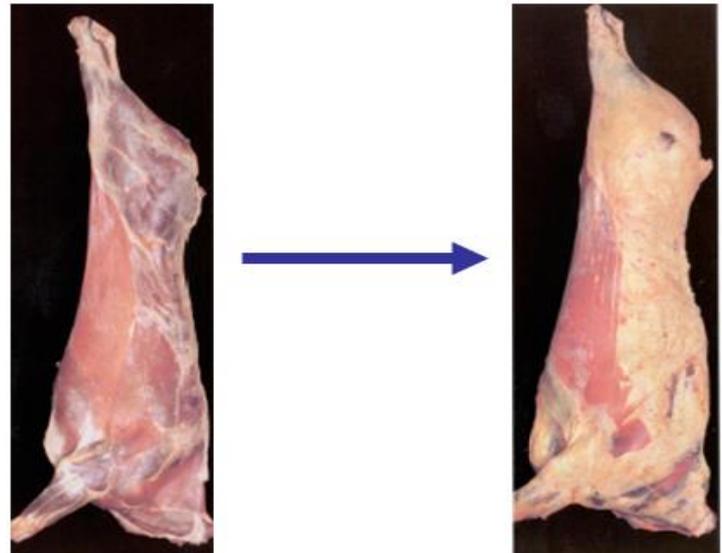

• EUROP Classification to grade carcasses

Conformation

S > E > U > R > O > P

Fat

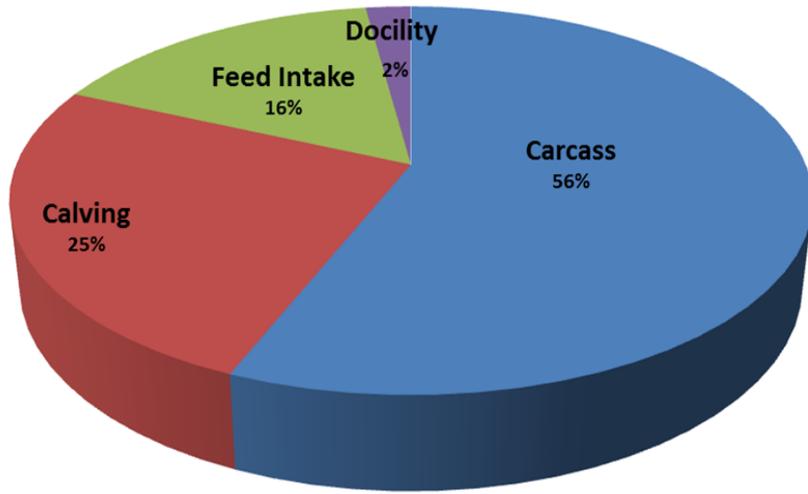

1 < 2 < 3 < 4 < 5

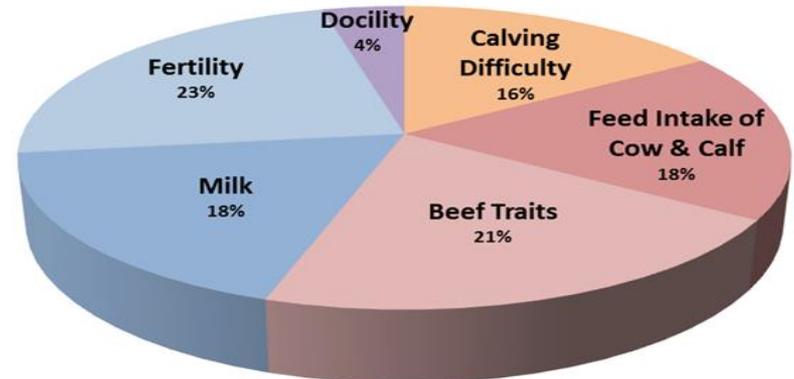

€uro-Star indexes

- ❖ Currently we use carcass weight, conformation and fat score as part of our genetic evaluations for terminal and replacement €uro-Star Indexes.

ICBF Terminal Index

ICBF Replacement Index

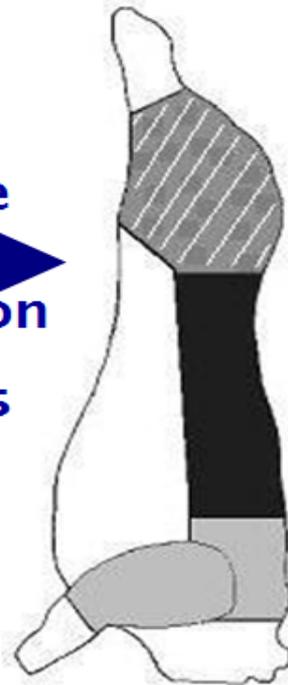

Predicting cuts using VIA images

- ❖ 8% of carcass weight accounts for over 30% of carcass value (Drennan et al., 2008)

· Converting images into cut weights

**Multiple
Regression
Analysis**

-  Lower value cuts
-  Medium value cuts
-  High value cuts
-  Very high value cuts

Also available on steers:

- Total meat weight
- Total fat weight
- Total bone weight

Validation results

	Carcass weight (CCW)	CCW plus EUROP	CCW plus VIA
Total meat	0.91	0.97	0.97
Total fat	0.33	0.74	0.77
Total bone	0.66	0.79	0.81
Lower Value Cuts	0.97	0.89	0.92
Medium Value Cuts	0.74	0.79	0.86
High Value Cuts	0.75	0.89	0.93
Very High Value Cuts	0.74	0.85	0.84

T. Pabiou et al. / Livestock Science 137 (2011) 130–140

- ❖ Since 2007 ICBF have been storing 1.6 million VIA images per year.
- ❖ Further develop and validate the prediction equations for VIA images across genders **using 81630 carcasses.**

Conclusions

- Meat eating quality exhibits genetic variation. No differences between breeds.
- Need to collect more data - Excellent industry engagement in the collection of relevant phenotypes.
- Look more closely at more routinely available predictors (pH, shear force, image data.....)
- Assign a monetary value for each unit increase in eating quality with a view to publishing a genetic index for eating quality.
- Genomics is going to play an important role in identifying elite sires for meat quality.
- VIA are an important tool to predict carcass cuts and composition.
- All stages of the food chain can effect meat quality. Therefore everyone has to work together to ensure consumers consume more beef and are willing to pay appropriately in order to return a profit to all involved.

Thank You!
